

**STATE FACTSHEET**

# Texas

2017

ATSDR partner, The Texas Commission on Environmental Quality (TCEQ) conducted an investigation at The Circle Court Groundwater Plume site in the city of Willow Park in Parker County, Texas. The site consists of a trichloroethylene (TCE) groundwater plume in the Trinity Aquifer. TCEQ and the United States Environmental Protection Agency (EPA) collected water samples from private and public drinking water wells to determine the nature and extent of the contamination. Of the 37 wells sampled, TCE was detected in 5 drinking water wells above the EPA's maximum contaminant level. The investigation concluded that adverse health effects may have occurred from past exposure to TCE, arsenic, and lead in some of the private wells but there are no current or future exposures to the water from these wells.
